

# Two Message Device

## Features & Benefits

- Two message device
- 11 seconds total message length
- Excellent audio quality at 11.025KHz
- Pre-programmed in-house
- Volume adjustable remotely to 50% of local settings.
- Polycarbonate enclosure
- Positive or negative common compatible

## Two Message Device

Our two message device can store up to two pre recorded voice messages in internal flash memory.

Each message is played by applying an input voltage to either tone input and are programmed via a WAV file.

The two message device is programmed in house to any message you require.

An example of usage for this device is within the rail infrastructure, where an advisory message is played when a passenger is alighting the lift. Other messages could be for passenger safety purposes such as 'mind the step when alighting the lift'.

The volume can also be reduced remotely by 50% for a user determined period by applying an input voltage to an AUX input. In this way messages can be played at full volume between certain periods of the day.
